THIS WEEK'S FILE · FOUNDER FILE #012

SABRINA RAMONOV AND THE ONE-PERSON CONTENT MACHINE THAT BECAME A SOFTWARE BUSINESS

A founder who sold her first company built a tool because she was tired of rewriting and rescheduling her own posts. She says it now earns millions a year with no team. Here is the workflow, what is checked, and what is only her word.

THE FILE

FOUNDER	Sabrina Ramonov, Solo founder and AI educator
COMPANY	Blotato
FOUNDED	Undisclosed
HQ	Undisclosed
SECTOR	Social media automation (AI agents)
STAGE	Bootstrapped, solo (self-reported)
FUNDING	None (self-reported)
MODEL	Subscriptions from $29 a month, plus an API and MCP server for AI agents

Hello again, and welcome to File #012. Thank you for reading.

Sabrina Ramonov says she hates making content. She also says that, with a small set of AI tools, she publishes about 250 pieces a week across roughly ten platforms, and that the system she built to do it is now a software business making millions of dollars a year. She says she does it alone.

That is a lot of claims in two sentences, and this file is about sorting them. Some are public and checkable, some are her own account, and some are what a tool's own marketing says. The useful part, the workflow, is worth reading carefully either way. (All figures are in US dollars. Unless we say otherwise, they are hers.)

THE SHORT VERSION

- **Who:** Sabrina Ramonov, a former founder who sold her first company, and who now teaches AI to a large online audience.
- **What:** Blotato, a tool that lets people (and AI agents) write, schedule and post to nine social platforms and manage comments and messages, starting at $29 a month.
- **Why it matters:** it is a clear example of a founder building a product for herself, using her own audience as distribution, and plugging it into AI assistants like Claude so that one person can run a high-volume content operation.
- **The number to remember:** 250. The pieces of content she says she publishes each week, and the one number in this file that describes the method, not the money.

THE FOUNDER

By her own About page, Sabrina was born in Quezon City in the Philippines and studied computer science and physics at the University of California, Berkeley, graduating with about $250,000 in student loans. At 23 she founded Qurious, a language-processing company aimed at healthcare. It didn't find a market, so she pivoted to real-time guidance for sales and support calls.

Her page says that in 2018 she was named to Forbes 30 Under 30 in the enterprise technology category. We couldn't confirm that on Forbes's own list, so treat it as her claim. What is documented is that the software company Pegasystems announced it was acquiring Qurious in January 2021. The price wasn't disclosed in anything we found, and one profile puts it at more than $10 million without a source. Pega turned it into a customer-service voice product.

Qurious was co-founded with George Ramonov, whom one profile describes as her husband. A BootstrapLabs post about the acquisition names her as Sabrina Atienza, which looks like a former surname. We mention it because the old name is how you find the old coverage.

WHY SHE BUILT BLOTATO

She says she was overwhelmed by her own content work: rewriting captions for each platform, resizing video, designing carousels and juggling tools that didn't talk to each other. She built a tool for herself first and then turned it into a product. She told Inc. in October 2026 that she built it because she is lazy about making content.

We could not find a launch date for Blotato anywhere. Her About page doesn't give one.

WHAT IT DOES

According to Blotato's own pages, it is a social media API and a hosted "MCP server", the standard that lets AI assistants like Claude and ChatGPT use outside tools. With it, an AI agent can publish to nine platforms (X, LinkedIn, Facebook, Instagram, TikTok, YouTube, Threads, Bluesky and Pinterest), schedule posts, read comments, send replies and direct messages, run keyword-triggered DM automations on Instagram and Facebook, and pull analytics. It can also turn a YouTube video, article or PDF into posts, and make carousels, slideshows and AI-avatar videos. It connects to Claude, Claude Code, ChatGPT, Cursor and others, and to automation tools such as n8n and Make.

Pricing starts at $29 a month with no per-post fees, a seven-day free trial and, to begin with, 20 connected accounts. Other plans exist, and an independent review we found flags a "credit catch" on the plans, so check what each one includes before you rely on a capability.

THE WORKFLOW

In April 2026, Sabrina described her method on HubSpot's Marketing Against the Grain podcast. A trade site, MarTech Series, summarised it in May. The steps are simple.

1. **Teach the AI your voice first.** Build a custom writing skill in Claude (the report names Claude Cowork) that learns your brand voice through an interview.
2. **Start from one source.** Draft platform-specific posts from a single idea, including raw images and screenshots.
3. **Connect the tool.** Link Blotato to Claude, which the report says takes about a minute.
4. **Generate visuals.** Make infographics from templates inside the chat.
5. **Schedule everywhere.** Use plain-English prompts to schedule posts across platforms, with different media for each.
6. **Review the calendar.** Check and adjust it in Claude or Blotato's dashboard.

Two things she says stand out. First: "Most AI writing sounds like AI. Generic. Polished. Forgettable." Her answer is to teach the model your voice before it writes anything. Second, and this is the part many readers will want to know, what she keeps human: she says she checks every single piece before it goes out, and she cautions beginners against fully automated pipelines with no review. Blotato's own site says its tool is not for long-form video clipping, spam-style video farms, or "low-effort AI spam".

She also says she makes it clear when something is AI-generated: her avatar wears a hat, so viewers can tell.

WHAT IS CLAIMED, AND HOW RELIABLE IT IS

CLAIM	WHERE IT COMES FROM	HOW TO TREAT IT
Sold Qurious to Pegasystems	Pega's announcement in January 2021, per BootstrapLabs	Confirmed. Price undisclosed
Forbes 30 Under 30, 2018	Her About page	Unconfirmed by us
250 pieces of content a week	MarTech Series, summarising her podcast	Her claim
2.4 million followers (podcast coverage), "3 million or more" (About page)	Her claim	Self-reported. Figures vary by source and date
A new Facebook page reached 46 million organic views in three months	MarTech Series	Self-reported
"Millions in ARR from Blotato alone", no courses or info products	Her statement, reported by Inc. and a podcast	Her claim. No figure given
10,000 or more business owners; "thousands of paying teams"	Blotato's site	Company claim
667,000 or more posts published last month	Blotato's site	Company claim
One reel generated $120,000 of annual recurring revenue	Her own tutorial	See below

That last one deserves a note. Her tutorial says a single Instagram reel generated $120,000 in annual recurring revenue "for my business". The page doesn't explain the period, how the revenue was attributed to the reel, what the business sells, or whether it was Blotato. It's a promotional how-to that uses Blotato throughout. We haven't used the figure.

THE HONEST PICTURE OF THE NUMBERS

Blotato's revenue isn't clearly published, and that is still true in the sense that matters. The strongest statement is a founder's remark that she has scaled "to millions in ARR" from Blotato alone. A third-party directory estimates $500,000 to $2 million but labels it an estimate. There's no audited figure and no revenue number on Blotato's own pages.

Her audience figures are public and large, but they differ by source: nearly 2 million, 2.4 million, over 3 million. Her YouTube channel is listed at different sizes in different places.

None of that means the business isn't real. It means you should read "millions" as an unverified range.

WHY THE CONTENT IS ALSO THE MARKETING

The structure is worth noticing. She teaches people how to use AI to run content, in public, and shows the workflow on Blotato. Her audience becomes the customer base. The tool exists because she needed it, and she says she builds the product first and teaches it second. It's the same loop as Marc Lou's and Pieter Levels', run on content instead of code: the audience gives distribution, and the product gives the audience something to do.

It also means there is a conflict of interest in almost everything published about it. Her tutorials, her podcast appearances and Blotato's own blog all promote the same product. Trade coverage of her workflow, such as the MarTech Series piece, is itself promotional. Treat all of it as a founder's account.

Try this

Teach the AI your voice before you ask it to write. Give it ten of your best posts and ask it to describe your style. Use that description every time.

One source, many posts. Record or write one long piece a week. Ask for a version for each platform, in that platform's style.

Keep one rule you never break. Hers is "I check every single piece". Decide yours before you automate anything.

Label what's AI. Decide how you'll tell your audience, and stick to it.

Build the tool you need first. If you wouldn't use it yourself every week, it's not ready to sell.

WHAT COULD GO WRONG

Quality and trust. High-volume, AI-assisted content can read as generic, and audiences are quick to notice. Her own answer is review and voice. At 250 pieces a week, "reviewing everything" is a lot of work, and we couldn't see how it is done.

Platform rules. The product depends on the platforms' tools for publishing and messaging. Their policies on automation, spam and AI content change, and can change quickly.

Audience dependence. AI multiplies output but doesn't create trust. Her distribution is her following, which took time to build and could shrink.

A crowded, fast-moving category. Scheduling tools are everywhere, and the large AI assistants keep adding their own integrations. Blotato's pitch is that it is the infrastructure agents plug into, which depends on those assistants continuing to support outside connectors.

One person, many things. She says she runs the product, the support and the content herself. That concentrates risk.

Claims you can't check. Revenue, followers and views are self-reported, and the one dollar figure with a clear number is unexplained.

WHAT TO WATCH

1. **Whether she publishes a revenue figure** or lets someone verify it.
2. **Whether the plug-in model holds.** Do the big AI assistants keep supporting outside tools like Blotato?
3. **Platform policy.** Whether Meta, TikTok and others tighten the rules on automated posting and AI-generated content.
4. **Her audience.** Whether it keeps growing at the pace she says, and whether it turns into customers.

She says she's lazy about content. What she actually did was build a system, learn it in public, and make a product out of it. The method is more useful than the headline number.

That's File #012. Thank you for reading it. If it made you think of someone, forward it along, and if there's a founder you'd like to see opened next, tell us at info@aifounderfiles.com. File #013 lands next Sunday.

Where this came from: Blotato's own pages, Sabrina Ramonov's tutorials and interviews, MarTech Series, Inc. and a podcast we could not hear in full, plus an independent review. Nearly all of it is a founder's own account or promotional coverage, and we say so. We have not spoken to her. A note on disclosure: Blotato connects to Claude, which is made by Anthropic, and Claude helped research and draft this file. Spotted a mistake? Email info@aifounderfiles.com and we'll correct it.
