THIS WEEK'S FILE · FOUNDER FILE #012

SABRINA RAMONOV SAYS SHE HATES MAKING CONTENT. SHE PUBLISHES 250 PIECES A WEEK

A founder who sold her first company built a tool to take the drudgery out of her own social media. She now says that tool earns millions a year, with no staff. The workflow is worth copying whatever you make of the numbers, and we have sorted her claims into what can be checked and what is only her word.

THE FILE

FOUNDER	Sabrina Ramonov, Solo founder and AI educator
COMPANY	Blotato
FOUNDED	Undisclosed
HQ	Undisclosed
SECTOR	Social media automation (AI agents)
STAGE	Bootstrapped, solo (self-reported)
FUNDING	None (self-reported)
MODEL	Subscriptions from $29 a month, plus connections that let AI assistants post for you

Hello again, and welcome to File #012. Thank you for reading.

If you post anything online for your business, you know the routine. You write something good. Then you rewrite it shorter for one platform and longer for another. You crop the picture square, then tall, then wide. You make a version with slides. You log in to five different apps and paste, schedule, check. An hour has gone and you've said one thing.

Sabrina Ramonov did that for a while and decided she hated it. She's an engineer, so she built a machine to do it for her.

She now says she publishes about 250 pieces of content a week across roughly ten platforms, alone, with no editor and no assistant. She says the machine she built has become a software business earning millions of dollars a year. And she says she makes

original content just one day a week.

Those are big claims, and some of them can't be checked. So this file does two jobs. It shows you the workflow, which is useful whoever you are. And it sorts the claims into three groups: public record, her own account, and marketing. (All figures are in US dollars.)

THE SHORT VERSION

- **Who:** Sabrina Ramonov, an engineer and founder who sold her first company in 2021 and now teaches people how to use AI.
- **What:** Blotato, a tool that takes one piece of content, reshapes it for nine social platforms and posts it on a schedule. It can also be operated by an AI assistant such as Claude or ChatGPT, so you can run it by typing instructions.
- **Why it matters:** it's a clear example of a founder building a tool for her own problem, using her own audience to sell it, and letting AI do the repetitive middle of the job while she does the two ends.
- **The number to remember:** 250. That's how many pieces of content she says she publishes a week. Next to it, remember that she says she checks every single one.

THE FOUNDER

According to her own About page, Sabrina was born in Quezon City in the Philippines. She studied computer science and physics at the University of California, Berkeley, and left with about $250,000 in student loans.

At 23 she started a company called Qurious. The first idea was to use language-processing software in healthcare. It didn't find customers. She changed direction and built something that listened to sales and customer-support calls as they happened and prompted the person on the phone with what to say next.

That version worked well enough to be bought. In January 2021 the American software company Pegasystems announced it was acquiring Qurious. That part is public record. The price wasn't disclosed. One profile says more than $10 million, without a source. Pega turned the technology into a product for its customer-service software.

Two notes for anyone who goes looking. A post about the deal from one of her investors names her as Sabrina Atienza, which appears to be her earlier surname, and it's the name the older coverage uses. And her About page says she was named to the Forbes 30 Under 30 list for enterprise technology in 2018. We couldn't find her on Forbes's own pages, so we're reporting that as her claim.

After the sale she had money and, we assume, some time. At 33, by her own account, she started making videos to teach people about AI. She set herself a goal of teaching a million people for free. She has since raised it to ten million.

WHY SHE BUILT IT

Teaching a million people means posting a great deal. She found herself in the routine from the top of this file, and she describes the result plainly: she was overwhelmed by rewriting captions, resizing videos, designing slides and juggling tools that didn't talk to one another.

So she built a tool for herself. Later she turned it into a product. She told Inc. magazine in October 2026 that she built it because she's lazy about making content.

A post of hers from February 2025 explains how she decided to sell it. She plays down the AI on Blotato's own website, she wrote, because "I want to attract ppl with the problem, not the curiosity". People who are curious about AI tend to try a tool and leave. People with a problem are more likely to stay and pay for it.

We couldn't find a launch date for Blotato. Her site doesn't give one.

WHAT BLOTATO DOES

Going by its own pages, Blotato does three things.

It reshapes. Give it one source, such as a video, an article, a PDF or a voice note, and it produces versions suited to each platform, along with slides, carousels, infographics and short videos.

It posts. It publishes to nine platforms, including Instagram, TikTok, YouTube, LinkedIn, Facebook and X, either immediately or on a schedule.

It handles replies. It can read comments and messages. On Instagram and Facebook it can run the kind of automation you've probably seen: comment a keyword under a video, and you're sent a link by private message.

In the last year or so she has added something newer. Blotato now connects directly to AI assistants through a standard called MCP, which lets an assistant like Claude or ChatGPT operate other software. In practice you can type "schedule this to LinkedIn tomorrow at nine and make a carousel version for Instagram" into a chat window, and the assistant does it through Blotato. She has started calling the product the infrastructure that AI agents use for social media.

Pricing starts at $29 a month. Higher tiers go up to several hundred. One independent review warns of a "credit catch", meaning that some features use up a monthly allowance, so read the plan details before you depend on any one feature.

THE WORKFLOW

In April 2026 she walked through her method on a marketing podcast run by HubSpot, and a trade site summarised it the following month. We've restated it as six steps that you could follow with almost any tools.

1. **Teach the AI your voice before anything else.** She builds a reusable set of writing instructions inside Claude by having the AI interview her about how she writes and what she'd never say.
2. **Start from one source.** One idea, one recording or one rough draft, including raw screenshots and photos.
3. **Have the AI draft a version for each platform,** in that platform's style, using the voice from step one.
4. **Generate the visuals** from templates, in the same conversation.
5. **Schedule everything** by typing plain instructions.
6. **Review the calendar,** and adjust.

Two of her remarks deserve more attention than the steps do.

The first is about quality. "Most AI writing sounds like AI," she said. "Generic. Polished. Forgettable." Her answer is step one. If you ask an AI to write before you've taught it how you sound, you get the average of the internet.

The second is about what she doesn't hand over. "I still check every single piece of content that goes out," she said. She warns beginners against building a pipeline that publishes with nobody looking. Blotato's own website says it isn't meant for what it calls low-effort AI spam.

She also labels the artificial parts. When a video uses an AI-generated version of her, the avatar wears a hat, so viewers can tell which is which.

WHERE THE HUMAN IS

Put her workflow in a table and you can see the principle.

STAGE	WHO DOES IT
Deciding what to say	Her
Recording or writing the original	Her, about one day a week by her account
Rewriting for each platform	AI, in her voice
Making slides, carousels and clips	AI
Scheduling and posting	AI
Checking before it goes out	Her
Experimenting with new formats and topics	Her

She does the beginning and the end. The AI does the repetitive middle. She hasn't automated the thinking or the checking, and we'd suggest you don't either.

WHAT IS CLAIMED, AND HOW FAR TO TRUST IT

CLAIM	WHERE IT COMES FROM	HOW TO TREAT IT
Sold Qurious to Pegasystems in 2021	Pega's announcement, reported by her investor	Public record. Price not disclosed
Forbes 30 Under 30, 2018	Her About page	Her claim. We couldn't confirm it
250 pieces of content a week	Her, on a podcast	Her claim
Three million or more followers	Her site. Other sources say 2 million or 2.4 million	Her claim. It varies by source and date
A new Facebook page reached 46 million views in three months	Her, via a trade site	Her claim
"Millions in ARR" from Blotato, with no courses or other products	Her, to Inc. and on a podcast	Her claim. No figure given
No staff, no ads, no outside funding	Her About page	Her claim
10,000 business owners use it; 667,000 posts published last month	Blotato's website	Company marketing

One claim needs unpacking, because you'll see it quoted. A tutorial of hers is headlined with the statement that one Instagram reel made her $120,000 in annual recurring revenue. When we first read it, the page didn't explain how. A later trade report did: she says a reel with about 200,000 views brought in around $10,000 of new monthly subscriptions, and twelve times $10,000 is $120,000. In the same report she set it against another reel that passed 4 million views, to show that reach and revenue aren't the same thing.

That makes it clearer, and it remains her own attribution of her own sales. It is also the headline of a tutorial that teaches you to use her product.

AN HONEST LOOK AT THE MONEY

Blotato's revenue has never been published. The strongest statement is hers: millions a year, from the software alone. A third-party directory guesses at between $500,000 and $2 million and says plainly that it's a guess. Nothing has been audited, and her own site gives no figure.

That doesn't mean the business isn't real. Hundreds of customers have left public reviews, and the product plainly exists and works. But "millions" could mean two or it could mean nine, and until she says which, we don't know.

THE LOOP

The way her business fits together is worth noticing, because several founders in this series use the same arrangement.

She teaches people how to use AI for content, for free, in public. Every lesson shows the workflow, and the workflow runs on Blotato. Her audience grows. Some of them subscribe. The subscription pays for more teaching.

In effect her content is her marketing, and it also shows the product working. Marc Lou and Pieter Levels do the same thing with code.

There's a catch you should keep in mind as a reader. Almost everything written about her method promotes her product: her tutorials, her podcast appearances, Blotato's blog and even the trade articles. You should treat all of it as a founder's own account, and that applies to our sources too.

Try this

Teach it your voice first. Paste ten things you've written that sound most like you into an AI assistant. Ask it to describe your style: sentence length, favourite words, what you never say. Save that description and give it to the AI every time, before you ask for a draft.

Start from one source and make several versions. Make one good thing a week, whether that's a recording, an article or a customer story. Ask for a version for each place you post, in that place's style.

Draw your own table. List the stages of your content work, as we did above. Mark which are judgment and which are repetition, and only automate the repetition.

Keep one rule you never break. Hers is that she checks everything. Decide yours before you automate anything.

Tell people what's AI. She puts a hat on her avatar. Pick your own signal and use it every time.

WHAT COULD GO WRONG

Sameness. If everyone uses AI to turn one idea into ten posts, feeds fill up with competent, similar content. Her defence is voice and review. At 250 pieces a week, checking every one is a lot of checking.

The platforms. Blotato works by using the publishing and messaging tools that Instagram, TikTok and the others allow outsiders to use. Those companies change their rules on automation and AI content whenever they like.

The assistants. Her newer pitch depends on Claude, ChatGPT and others continuing to welcome outside tools, and not building the same features themselves.

One person. She says she runs the product, the support and the content alone. A lot of the risk sits with one person.

Her audience. The business is fed by her following. It took two years to build and could shrink faster than that.

Numbers nobody can check. The claims about revenue, followers and views are all hers.

WHAT TO WATCH

1. **A real revenue figure,** or anyone outside the company confirming one.
2. **Platform rules.** Whether Meta, TikTok and others tighten up on automated posting and AI-made content.
3. **The AI assistants.** Whether they keep supporting tools like hers or start competing with them.
4. **Whether she stays solo.** She says she runs a product with thousands of paying customers and no staff. That may not last.

She built a machine to do the part of the work she hated, and she kept the two parts that need a person, deciding what to say and checking it before it goes out. That division of labour is worth copying. As for the revenue, it may well be what she says, but nobody outside the company can confirm it yet.

That's File #012. Thank you for reading it. If it made you think of someone, forward it along, and if there's a founder you'd like to see opened next, tell us at info@aifounderfiles.com. File #013 lands next Sunday.

Where this came from: Blotato's own pages, Sabrina Ramonov's tutorials, posts and interviews, MarTech Series, MarTech Edge, Inc. and a podcast we couldn't hear in full, plus an independent review. Nearly all of it is a founder's own account or promotional coverage, and we say so. We haven't spoken to her. A note on disclosure: Blotato connects to Claude, which is made by Anthropic, and Claude helped research and draft this file. Spotted a mistake? Email info@aifounderfiles.com and we'll correct it.
